Panleukopenia 101
Feline Panleukopenia

- Panleukopenia
- Infectious enteritis
- Feline distemper
- “Cat plague”
- Feline parvo
- Cat Typhoid
Feline Panleukopenia

Caused by a feline parvovirus (FPV):

• Non-enveloped DNA virus
• Closely related to canine parvo (CPV)

Important features:

• Highly contagious, easily spread
• Stable, single strain virus
• Very durable – long-term persistence in the environment
• Can cause severe, potentially fatal disease
Who gets panleuk?

• ANY unvaccinated cat of any age

• Kittens, co-infected cats most susceptible to disease

• Cases occur all year long with some seasonality

  • Higher rates in spring/summer → more susceptible animals
FPV Transmission

Virus spread primarily through feces and vomit but present in nearly all bodily excretions

- Cat-cat direct contact
- Fomite transmission
- Environmental contamination
- Mechanical, vector transmission

Highly resistant in the environment – persists for up to a year

- Cleaning and disinfection using parvocidal products is critical!
FPV Transmission

Incubation period:
• Reported from 2-14 days
• 5-7 days most common

Viral shedding (contagious to other cats):
• Up to 2-3 days before clinical signs
• Weeks following recovery
FPV Transmission

Incubation period:
• Reported from 2-14 days
• 5-7 days most common

Viral shedding (contagious to other cats):
• Up to 2-3 days before clinical signs
• Weeks following recovery

Management challenge: May be contagious before symptoms start and for a period of time after they resolve
What happens when they get sick?

- Severe, potentially fatal disease

- Virus attacks rapidly dividing cells
  - Destroys the lining of the intestines
  - Vomiting, diarrhea, dehydration, electrolyte problems

- Wipes out bone marrow
  - Decreases in white blood cells hamper immune system’s ability to fight infection
What about cerebellar hypoplasia?

- FPV replicates in many tissues in the fetus
What about cerebellar hypoplasia?

• Early pregnancy:
  • Abortion
  • Birth defects
  • Infertility but queen otherwise seems fine
What about cerebellar hypoplasia?

• Late pregnancy to 1 week old:
  • Destroys Purkinje and granule precursor cells → cerebellar hypoplasia
  • Non-progressive ataxia noticed at 2-3 wks of age

• Other neuro or ocular signs less commonly reported
Clinical Signs of FPV Infection

**Symptoms** usually develop 5-7 days after exposure, but range is 2-14 days:

- Vomiting
- Depression
- Diarrhea
- Inappetance
- Dehydration
- Lethargy, weakness
- Sudden death
- Subclinical – no outward signs of illness
Clinical Signs of FPV Infection

Subclinical disease???
- Probably relatively common
- Adult immunocompetent cats
- Partial immunity

Severity influenced by:
- Age
- Immune status
- Concurrent infections
Diagnosis

Consistent symptoms and history

In-house parvo tests

• Developed for dogs but works for cats
• Looks for viral antigen in the feces
• False negative results possible
• May cross-react with recent MLV vaccination
  • Anecdotally weak positives within a week
• Not common (1/64) – safest is to assume infection
• Complete blood count (CBC) or smear
  • At 10X → 4-6 WBC per field or less
  • At 40X → 1-3 WBC per field of less

Caveat: not every cat will develop leukopenia
Diagnosis

PCR testing is also available

- Need to distinguish recent vaccination vs. natural infection
- Look for quantitative levels
- Available in “diarrhea panels”
Post-mortem diagnosis:

- Always necropsy cats that die in the cage
- Segmental enteritis is classic finding on gross exam
- Parvo test can still be used
- Samples for PCR or IFA, IHC tests and histopath
  - Tongue is an excellent sample to collect – very sensitive

Image from Greene’s Infectious Diseases of the Dog and Cat
Diagnosis: Necropsy

• Identify pathogens and their role in disease
• Often the most efficient way to get an accurate diagnosis
• Document initial findings

• Non-fixed samples for bacterial culture, viral isolation, parasitology testing
  • Obtain first
  • Refrigerated for bacteria, frozen for viruses
  • Small and large intestine
Diagnosis: Necropsy

- Tissue samples for histopathology
  - Preserve samples (9:1 ratio formalin: tissue)
Diagnosis: Necropsy

- Tissue samples for histopathology
  - Preserve samples (9:1 ratio formalin: tissue)
Preventive Strategies

• Plan A: Prevent exposure

  • If exposure can’t be zero, limit the dose to as little as possible:
    • Avoid overcrowding
    • Reduce length of stay
    • Excellent sanitation
    • Fomite control
    • Adequate isolation +/- quarantine
Preventive Strategies

• Plan B: Strengthen host defenses
  • Good husbandry, nutrition
  • Treat concurrent infections
  • Vaccination
  • Reduce stress
Preventing Exposure

Avoid overcrowding – stay within your capacity for care

Crowding = major stressor and risk factor for disease outbreaks

- Exacerbates challenges shelters already struggle to manage
- Not inevitable!
Capacity for Care

• Housing capacity
  • Not just an open cage, but an appropriate enclosure for that particular animal
  • Ideally below your max capacity

• Staffing capacity
  • Staff and/or volunteers to meet the physical and behavioral needs of that animal

• Additional sufficient resources as needed for that animal
  • Medications, vet care, training
Why Length of Stay (LOS) Matters

- Calculate holding capacity, adoption driven capacity, and amount of time available for animal care
- Knowing capacity for care, LOS, and average shelter populations helps with decision-making
  - Resource allocation
  - Staffing
  - Intake and adoption decisions
  - Cage space
- **Moving animals efficiently through the system is a win-win-win!**
What can we do TODAY to move that animal closer to their final outcome?

- Written SOP and criteria for behavior, medical to determine adoption, transfer, etc.
- Eliminate holds and bottle necks – extra staffing, resources, fast track/slow track program, etc.
Daily Rounds

The idea:
• Performed **DAILY 😊**
• Look at each animal in the building
• Decide where they are going
• Determine what they need to get there
• Figure out how to make happen!
Daily Rounds

Requires:

• Someone with training, knowledge, and authority
• A commitment by all staff and management to make it a priority

• Accurate data collection and entry
• Process +/- equipment to make it work
• Ideally, a rounds leader or task master with a team
Preventing Exposure

Excellent sanitation procedures and fomite control
Cleaning & Sanitation Protocols

• Cleaning & disinfection are actually two different things!

• Step 1 – Clean
  • Remove organic material
    • Detergent and scrubbing

• Step 2 – Disinfect
  • Inactivate pathogens
    • Start with a clean surface
    • Leave on required contact time
Sanitation Basics

• Sanitation is critical – we can’t rely on pathogens going away on their own

• CPV is resistant to many disinfectants
  • Cannot use quats – despite the label 😞
  • Bleach, trifectant, Accel all good choices

• Porous, organic materials are harder or impossible to sanitize
  • Limit contact of animals with surfaces that can’t be disinfected or disposed of
Sanitation Basics

• Sanitation is critical – we can’t rely on pathogens going away on their own
• CPV is resistant to many disinfectants
  • Cannot use quats – despite the label 😞
  • Bleach, trifactant, Accel all good choices
• Porous, organic materials are harder or impossible to sanitize
  • Limit contact of animals with surfaces that can’t be disinfected or disposed of
The sad facts about quats…

Disinfection Resources

http://www.aspcapro.org/search/index/disinfection
What does it mean to be clean?

- Kennels
- Cages
- Transport carriers
- Windows and walls
- Lobbies and halls
- Doors and doorknobs
- Play yards
- Vehicles
- Exam tables

- Bedding
- Toys
- Food and water bowls
- Collars and leashes
- Scoops, brushes, mops
- Clothing and footwear
- Ventilation ducts
- Phones, keyboards, etc.
- HANDS!!!
Sanitation Basics

Laundry:

- Hot water, detergent, bleach
- Dry thoroughly!
- Discard if heavily soiled
- Caution in and moving to laundry areas
A Simple, Yet Critical Fix

Wash your hands, change your gloves, wear PPE!!!

- We can be our own worst enemies – minimize fomite spread!
Preventing Exposure

Excellent sanitation procedures and fomite control

- Appropriate use of housing
- Labeled, dedicated equipment
- Dedicated staff
- Appropriate order of cleaning
- Diligent hand sanitation

KEEP CALM AND PPE
nursetopia.net
Preventing Exposure

Excellent sanitation procedures and fomite control

- Appropriate use of housing
- Labeled, dedicated equipment
- Dedicated staff
- Appropriate order of cleaning
- Diligent hand sanitation

Invest your time where you’ll get the most bang for your buck!
What is “adequate” PPE?

• Hint: It’s not just your hands and scrub top…
How about footbaths?

How about footbaths?

- Not reliably effective
- Can actually help spread disease

How about footbaths?

Dedicated footwear and/or shoe covers are better choices

Shouldn’t we just leave the cage open for a while?

• 1, 3, 5, or even 30 days won’t help if sanitation was inadequate

• Multiple thorough episodes of cleaning and disinfection can help but are not time dependent
Panleuk Vaccination

• Panleuk is considered to be a vaccine-preventable disease – “sterile immunity”

• Vaccination reminders:
  • Biologic products that stimulate the immune system
  • Given before exposure
  • Functioning immune system with time to respond
Panleuk Vaccination

• Vaccination reminders: MLV vaccines
  
  • Give as close to time of intake as possible, or before if at all possible
  • Must be kept refrigerated from time of arrival until time of administration
  • Must be mixed up fresh – do not mix and keep in the fridge for later use
Core Vaccination

• FVRCP given at intake for cats 4-6+ weeks old
  • Repeat q 14 days while in the shelter, stop after 16 weeks old

• Vaccination is highly effective for FPV:
  • Clinically relevant protection within hours
  • Immunity within 72 hours of administration

• Weigh exposure risk vs. vaccination risk
  • Rule of thumb: too sick to vaccinate = too sick to stay in the shelter

Panleuk Vaccination

This is a core vaccine – don’t assume they are protected!

Panleuk Vaccination

This is a core vaccine – don’t assume they are protected!

Good News!

“The time necessary to obtain the immunity of cats against Panleukopenia has been studied by means of a modified live vaccine. This vaccine makes it possible to obtain a very early post-vaccinal immunity: the full immunity is reached 72 hr after the inoculation of the vaccine by the subcutaneous route. Furthermore, we have demonstrated that a sensitive kitten can be admitted in a contaminated environment immediately after vaccination without showing any clinical evidence of the disease.”

Maternally-derived Antibody Interference

AKA – why kittens need so many vaccines!

![Graph showing antibody level decrease over age (in weeks).]
Feline Parvo Titers

• **The idea:**
  • Antibody levels for FPV correlated with protection from disease
  • Levels can help clarify susceptibility and risk in outwardly healthy cats

• **In-house test kits less helpful for identifying low risk cats than similar use in dogs**
  • Positive results fairly reliable
  • Negative results less so – may remove or quarantine inappropriately
Treatment

Careful consideration necessary when deciding to treat:

- Ability to provide humane level of care
  - Supplies, space/housing, staffing
- Ability to protect the remaining population – strict isolation is mandatory
- Retain focus on prevention
- Use of limited resources – prognosis can be poor even with aggressive treatment
Treatment Considerations
Panleuk diagnosis confirmed

Adequate ability to treat in house?
- Dedicated isolation space
- Excellent biosecurity
- Adequately trained staff/volunteers
- Supplies

Yes

Perform complete assessment of patient

Formulate and implement treatment plan

No

Resources available, patient candidate for transfer?

Yes

Immediate transfer

No

Humane euthanasia
Prompt identification of infected cats is key:

- Remove from general population early to reduce spread
- Timely treatment helps improve outcome

Written SOPs:

- Description and case definition
- Treatment
  - Do you treat? If so, who?
  - Initiating and administering
    - who, what, where, when, how
- Containment and management steps
- Intervention points and next steps
Do you have an appropriate isolation space?

- Ideally, physically separate building
- Minimally, separate, easily disinfected area
- Adequate monitoring and sufficient staffing mandatory
- Full body protection, double gloves, footwear, equipment
- No crossover with kittens/new intakes
Prognosis

• Higher mortality rates earlier in the course of treatment

• Tends to be a more protracted course of disease than canine parvo patients
Prognosis

• Typically considered to have higher mortality rates for kittens < 6 months of age vs. adults

Case series of feline panleukopenia virus in an animal shelter
Annette Litster and Chutamas Benjanirut
Journal of Feline Medicine and Surgery published online 19 July 2013
Prognosis

Published mortality rates range significantly:

• Peracute disease: 100%
• Acute disease: 25-90%

Prognostic factors:

• WBC < 1000
• Low platelet counts
• Low albumin or potassium levels
• Survival: 51.1% with aggressive therapy
Treatment

Treatment is supportive:

• Correct dehydration, hypoglycemia, electrolyte imbalances
• Prevent sepsis
• Address hypoproteinemia
• Stop vomiting, start feeding
• Alleviate pain and discomfort
Antimicrobial Therapy

- Antibiotics indicated due to neutropenia
- Variety of factors to consider in selection:
  - Time dependent vs. concentration dependent
  - Efficacy against pathogens likely to be of concern
  - Severity and progression of symptoms
  - Route of administration and absorption

- Common protocol:
  - Injectable penicillin with fluoroquinolone or aminoglycoside
  - Convenia for out-patient tx in dogs – efficacy in cats ???

- Remember: will not help with primary viral infection
Parasite Control

Co-infections exacerbate clinical illness from FPV
  • Increases GI cell turnover, viral replication

Treat orally as soon as possible
  • Panacur, fenbendazole, ponazuril
Tamiflu for Panleuk?

- Tamiflu - Oseltamivir phosphate – neuraminidase inhibitor
- Described anecdotally for use in dogs, less commonly in cats
- One dog study failed to show response:
  - Weight gain, normal WBC but clinical signs and survival the same
- Not recommended for treatment of panleuk cats

Treatment Parameters

- Must retain ability to provide humane care
- Regular monitoring is key – status can change rapidly

What requires revision of the plan?
- Options for further treatment
- Changing meds
- More aggressive therapy care
- Transfer for care?

- What are “stopping points” for your shelter?
After Treatment…

- Time to recovery depends on severity of clinical signs and form of disease – generally longer than CPV

- Viral shedding usually stops within 2-3 weeks (but can extend to 6 weeks)

- Can SNAP or PCR before returning to general population

- Bathe and dry thoroughly!!!

- Vaccinate as usual

- Rehome ASAP
Help! We have Panleuk!

• Act promptly to limit spread
  • Stop movement – people, animals, equipment

Assess the risk, make a plan, and act on it – but do not panic.

  - Review sanitation, vaccination SOPs and procedures
  - Risks: crowding, co-mingling, etc.

Assess the risk, make a plan, and act on it – but do not panic.
Help! We have Panleuk!

- Act promptly to limit spread
  - Stop movement – people, animals, equipment
- Establish/confirm diagnosis
- Map the cases
- Determine animal movement
- Create a timeline
  - Clinical signs vs. onset of shedding
- Review individual animal risk
  - Location, age, vaccination
- Evaluate shelter practices
  - Review sanitation, vaccination SOPs and procedures
  - Risks: crowding, co-mingling, etc.
- Make decisions for individual animals:
  - Treatment, quarantine, adoption, euthanasia

Assess the risk, make a plan, and act on it – but do not panic.
What two things heard in this webinar will you try in the next month?
